FIBERSTRONG® RIM BOARD

GP LAM® LVL

BUILD ON THE STRENGTH OF OUR COMMITMENT

If you need high-quality engineered lumber, look no further than Georgia-Pacific. We pride ourselves on the quality and performance of our products, but it's how we perform in other areas that helps set us apart.

WE ARE HERE FOR YOU.

Our continued investment in the engineered lumber business means we are here to meet your needs. First, we go out of our way to understand your business. Then, we offer you a full-line of engineered lumber products, when and where you need them. When you think of Georgia-Pacific, think two words, trust and dependability.

OUR JOB IS YOUR SATISFACTION.

Our philosophy is that if we listen to your needs and service you well, you'll remain a satisfied customer. It sounds simple. Yet it's surprising how many suppliers just don't get it. We communicate with you. We provide you with the technical support you need. And we respond to your needs quickly and professionally.

WHEN YOU LOOK AT A PRODUCT
IN THIS CATALOG,
NEVER FORGET THE STRONG COMMITMENT
THAT STANDS BEHIND IT.

WOOD I BEAM™ JOISTS

WOOD I BEAM™ JOIST FEATURES AND BENEFITS

- Engineered to deliver consistent stiffness and strength characteristics
- Dimensional stability helps minimize floor squeaks and helps reduce callbacks
- Resists shrinking and twisting for less waste and more consistent performance
- Available with solid sawn lumber or laminated veneer lumber (LVL) flanges
- Available in value lengths from 20' to 48' (lengths up to 60' by special order)

SYSTEM PERFORMANCE

The ultimate goal in the design of a floor or roof system is the end user's safety and satisfaction. **Although joists used at spans indicated in this guide meet or exceed minimum code criteria and will safely support the loads imposed on them as outlined in this guide, judgement must be used to adequately meet user expectation levels.** These expectations may vary from one user to another.

- The specifier should consider the meaning of a given deflection limit in terms of allowable deflection and the effects this could have on the system. For example, L/360 (span/360) for a 30' span is 1" of deflection. L/240 would be 1 1/2", and L/180 would be 2" of deflection. Consideration might also be given to cases in which a joist with a long span parallels a short span or a foundation end wall. For example, a 30' span with up to 1" of allowable live load deflection could be adjacent to an end wall with no deflection, causing a noticeable difference in floor levels under full design load.
- **A stiffer floor will result from using a live load deflection limit of L/480 versus the code minimum L/360.** A roof system with less total load deflection than the code required L/180 may be achieved by using an L/240 criterion.
- In addition to more stringent deflection limits, several other factors may improve overall floor performance. **Reducing joist spacing and/or increasing the subfloor thickness will lessen deflection between adjacent joists and increase load sharing. For increased floor stiffness, gluing the subfloor to the joists is recommended before nailing or screwing, rather than nailing only.**
- As with any construction, it is essential to follow proper installation procedures. Joists must be plumb and anchored securely to supports before system sheathing is attached. Supports for multiple span joists must be level. When installing hangers, joists should be firmly seated in the hanger bottoms. Leave a 1/16" gap between joist end and header.
- **Vibrations may occur in floor systems with very little dead load,** as in large empty rooms. A gypsum wallboard ceiling attached to the bottom of the joists will generally dampen vibration as will interior partition walls running perpendicular to the joists. If a ceiling will not be attached to the bottom of the joists, vibration can be minimized by nailing a continuous 2x4 perpendicular to the bottom of the joists at midspan running from end wall to end wall. Where future finishing of the ceiling is likely, x-bridging or Wood I Beam blocking panels may be used in place of the 2x4.

NOTES:

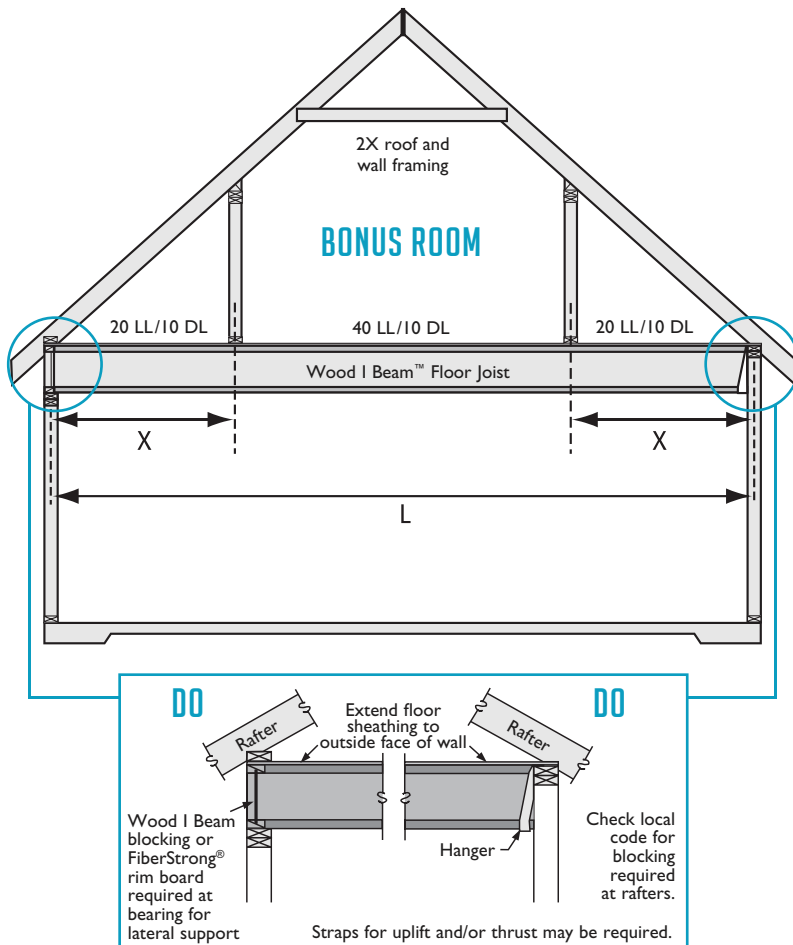

- These span tables are based on uniform loads, as noted above; live load deflection is limited to L/480 for better performance. Floor performance is greatly influenced by the stiffness of the floor joists. Experience has shown that joists designed to the code minimum live load deflection (L/360) will result in a floor which may not meet the expectations of some end users. Floor systems stiffer than L/480 may be desired.
- Spans are clear distances between supports, and are based on composite action with glued-nailed APA Rated® sheathing or Sturd-I-Floor® panels of minimum thickness 1⅜" (40/20 or 20 o.c.) for joist spacing of 19.2" or less, or 2⅜" (48/24 or 24 o.c.) for a joist spacing of 24".

- Adhesive must meet APA AFG-01 or ASTM D 3498. Apply a continuous line of adhesive (about ¼" diameter) to top flange of joists. All surfaces must be clean and dry. If sheathing is nailed only (not recommended), reduce spans by 12".
- Minimum end bearing length is 1¾". Minimum intermediate bearing length is 3½".
 - For multiple-span joists: End spans must be at least 40% of the adjacent span. Spans shown above cover a broad range of applications. It may be possible to exceed these spans by analyzing a specific application with FASTBeam® selection software.
 - For loading other than that shown above, refer to Uniform Load Tables, use FASTBeam software, or contact Georgia-Pacific Engineered Lumber Technical Services.

1. Double joist (2-ply) is denoted by "Dbl". Both joists must be glued and nailed as required for floor sheathing. No filler blocking required when top-loaded only.
2. A 2¹/₂" minimum bearing length must be provided by support wall or hanger seat.
3. A 3" minimum bearing length must be provided by support wall or hanger seat.
4. To be used in this application, the joist requires bearing stiffeners at both ends per detail F18.

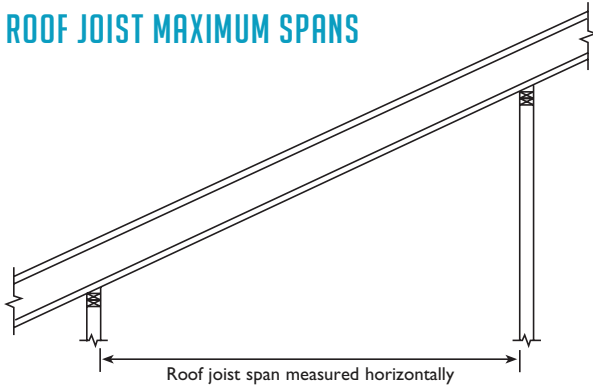

DESIGN PARAMETERS:

1. Glued and nailed floor sheathing.
2. Deflection limits: L/240 total, L/480 live load, unless noted otherwise.
3. Roof loads of 30 PSF live load at 115% (snow load).
4. Roof dead load of 12 PSF (asphalt shingles).
5. Roof rafter slope between 8/12 and 12/12.
6. Kneewall weight of 40 PLF.
7. Attic storage load of 20 PSF live load (outside the kneewalls).
8. Floor live load of 40 PSF (between the kneewalls).
9. Attic and floor dead load of 10 PSF.
10. Straight gable roof framing is assumed for selection table.
11. For other conditions, including holes, use FASTBeam® software or call Georgia-Pacific at 877-437-9759.

ROOF JOIST MAXIMUM SPANS

NOTES:

1. Roof joists to be sloped min. 1/4" in 12". No camber provided.
2. Maximum deflection is limited to L/180 at total load, L/240 at live load.
3. Maximum slope is limited to 12" in 12" for use of these tables.
4. Tables are based on the more restrictive of simple or multiple spans.
5. End spans of multiple-span joists must be at least 40% of the adjacent span.
6. For other loading conditions or on-center spacings, refer to Uniform Load Tables or use FASTBeam® selection software.
7. Minimum end bearing length is 1 3/4". Minimum intermediate bearing length is 3 1/2".
8. Spans shown below cover a broad range of applications. It may be possible to exceed these spans by analyzing a specific application using FASTBeam software.
9. Tables apply to gravity loads only.
10. Dead load is calculated along the joist length.
11. 20 psf non-snow live loads have been reduced per code for slopes of over 8/12 through 12/12.

ROOF JOIST MAXIMUM SPANS - 115% (SNOW) Refer to Notes on page 8.

DEAD LOAD MATERIAL WEIGHTS

Pounds per square foot (PSF)

Material	PSF	Material	PSF	Material	PSF
Sheathing and Decking		Roofing		2x Framing (12" o.c.)	
1½" Plytanium® Plywood	1.1	2-15 lb. and 1-90 lb. rolled	1.7	2x4 (for 16" o.c. divide by 1.33)	1.4
1½" Plytanium Plywood	1.5	3-15 lb. and 1-90 lb. rolled	2.2	2x6 (for 16" o.c. divide by 1.33)	2.2
1¾" Plytanium Plywood	1.8	3-ply and gravel	5.5	2x8 (for 16" o.c. divide by 1.33)	2.9
2¾" Plytanium Plywood	2.2	4-ply and gravel	6.0	2x10 (for 16" o.c. divide by 1.33)	3.7
¾" Plytanium Plywood	2.6	5-ply and gravel	6.5	2x12 (for 16" o.c. divide by 1.33)	4.4
1½" Plytanium Plywood	3.4	Single-ply membrane	2.0	GPI (for 19.2" o.c. divide by 1.6)	2.3–4.8
¾" OSB	1.3	and gravel	5.5	WI (for 19.2" o.c. divide by 1.6)	2.6–4.5
7/16" OSB	1.5	Asphalt shingles	2.5	See page 28 for weight per lineal foot	
½" OSB	1.7	Tough-Glass®	2.1	Interior Walls (wood or steel studs)	
1¾" OSB	2.0	Tough-Glass® Plus	2.4	½" gypsum board each side	8.0
2¾" OSB	2.6	Summit®	2.5	¾" gypsum board one side plaster one side	12.0
1x decking	2.3	Summit® III	3.0	Plaster both sides	20.0
2x decking	4.3	Wood shingles	3.0	Exterior Walls (2x6 studs with insulation)	
3x decking	7.0	Asbestos-cement shingles	4.0	½" gypsum board and wood siding	10.0
18 gauge metal deck	3.0	Clay tile (minimum)	10.0	¾" gypsum board and cement siding	12.0
20 gauge metal deck	2.5	Concrete tile (Monier®)	9.5	¾" gypsum board and stucco	18.0
Ceilings		Spanish tile	19.0	Windows, glass, frame and sash	8.0
½" gypsum board	2.2	Floor Finish		¾" gypsum board and brick veneer	48.0
¾" gypsum board	2.8	Hardwood (nominal 19)	4.0	Note: Wall weights are per square foot of wall	
Metal suspension system w/acoustical tile	1.8	Carpet and pad	2.0	Multiply weight times wall height for plf.	
Wood suspension system w/acoustical tile	2.5	Linoleum or soft tile	1.5	Insulation (per 1" thickness)	
1" plaster with lath	8.0	¾" ceramic or quarry tile (w/out mortar)	10.0	Rigid	1.5
Miscellaneous		½" mortar bed	6.0	Batts	0.5
Mechanical ducts	2.0–4.0	1" mortar bed	12.0	1.0–2.0 PSF is recommended for miscellaneous	
Skylight, metal frame ¾" glass	8.0	Floor Fill		dead loads.	
Stucco	10.0	½" lightweight concrete	14.0		
		½" regular concrete	18.0		
		¾" GYP-CRETE®	6.5		

GENERAL NOTES AND INFORMATION FOR ALLOWABLE UNIFORM LOADS – FLOOR AND ROOF

(use these general notes for pages 12-13)

- Table values are based on: (a) clear distance between supports, (b) simple or multiple spans, (c) spans of multiple span joists at least 40% of adjacent span.
- Uniform loads shown below cover a broad range of applications. It may be possible to exceed these loads by analyzing a specific application using FASTBeam® software. For cases with cantilevers or point loads, use FASTBeam software or contact Georgia-Pacific.
- Both live and total loads must be checked—live load against the Live row and total load against the Total row. When no value is shown in the Live row, Total load will govern.
- Verify that the deflection criteria herein are accepted by local codes and authorities.
- Provide lateral support at bearing points and continuous lateral support along the compression flange of each joist.
- Minimum end bearing length is 1¾". Minimum intermediate bearing length is 3½".
- For double joists, double the table values and connect joists per detail F11.
- For proper installation procedures, refer to appropriate sections in this publication.
- Table does not include additional stiffness from composite action with glue-nailed or nailed decking.

PSF TO PLF CONVERSION

Load in pounds per lineal foot (PLF)

O.C. SPACING	SPACING FACTOR	LOAD IN POUNDS PER SQUARE FOOT (PSF)

CALCULATING UNIFORM LOADS (PLAN VIEW)

Joist Spacing (L1, L2)

$$\left(\frac{L1(\text{ft.})}{2} + \frac{L2(\text{ft.})}{2}\right) \times LL(\text{psf}) = LL(\text{plf})$$

$$\left(\frac{L1(\text{ft.})}{2} + \frac{L2(\text{ft.})}{2}\right) \times TL(\text{psf}) = TL(\text{plf})$$

Check resulting loads against those in the appropriate table.

9 in 12	1.250	0.594	0.742	0.875	1.000
10 in 12	1.302	0.660	0.825	0.972	1.111
11 in 12	1.357	0.726	0.907	1.069	1.222
12 in 12	1.414	0.792	0.990	1.167	1.333

When using the uniform load table for roofs with slopes greater than 2" per foot, substitute the up-the-slope-span in the table on page 13.

EXAMPLE:

7/12 slope and 20'-0" horizontal span, 2'-0" overhang (horizontal) one end, 2x4 walls

Up-the-slope span: $20' \times 1.158 = 23.16'$ — use 24' joist span column to check load capacity.

Overall length: $L_h = 2' + 3.5''/12 + 20' + 3.5''/12 = 22.583'$

If a 14" joist will be used, $L_p = 0.681$ feet

$L = (22.583' \times 1.158) + 0.681' = 26.832' = 26'-10"$

STORAGE AND HANDLING

- Wood I Beam™ joists and FiberStrong® rim board should not be stored in direct contact with the ground and should be protected from weather. Provide air circulation under covering and around stacks of materials.
- Bundles should be stored level.
- Do not open bundles until time of installation. Use care when handling bundles and individual components to prevent injury to handlers or damage by forklifts or cranes.
- Stack and handle Wood I Beam joists in the upright position. Stack and handle FiberStrong rim board flatwise.
- Twisting of joists, or applying loads to the joist when flat can damage the joist.
- Damaged products should not be used.

SAFETY WARNING

Handlers and installers should use appropriate personal protective equipment such as gloves and goggles. An MSDS is available at www.buildgp.com.

Wood I Beam joists will not support workers or other loads until properly installed and braced. To minimize risk of injury, each Wood I Beam joist shall be properly fastened as it is erected. Continuous closure and/or blocking panels must be installed and attached to joists prior to installing floor or roof sheathing. Lateral restraint, such as an existing deck or braced end wall, must be established at the ends of the bay. Alternatively, a temporary or permanent deck (sheathing) may be nailed to the first 4 feet of joists at the end of the bay.

Rows of temporary bracing at right angles to joists must be fastened with a minimum of two 8d nails (10d box nails if net thickness of bracing exceeds 1") to the upper surface of each parallel joist and the

Protect products from sun and water. Use support blocks at 10' on-center to keep bundles out of water.

DO NOT store Wood I Beam joists flat.

DO NOT lift Wood I Beam joists by top flange.

DO NOT lift Wood I Beam joists in the flat orientation.

DO NOT allow workers or loads on Wood I Beam joists until properly installed and braced.

Stack building materials over main beams or walls only—**NOT** on unsheathed joists.

established lateral restraint. Bracing should be 1x4 minimum and at least 8' long with on-center spacing not to exceed 10'. Ends of adjoining bracing should lap over at least two joists. Stack building materials over main beams or walls only.

The following can result in serious accidents: improper storage or installation, failure to follow applicable building codes, failure to follow proper load tables, failure to use acceptable hole sizes and locations, or failure to use bearing stiffeners when required. Installation notes must be followed carefully.

INSTALLATION NOTES

- A. Engineered lumber must not be installed in direct contact with concrete or masonry construction per code and shall be used in covered, dry-use conditions only (moisture content less than 16%).
- B. Except for cutting to length and birdsmouth cuts, top and bottom flanges of Wood I Beam™ joists shall not be cut, drilled or notched.
- C. Concentrated loads shall only be applied to the upper surface of the top flange, not suspended from the bottom flange. Contact Georgia-Pacific for exceptions.
- D. When nailing to the wide face of the flange surface, maintain spacing in the ranges shown below:

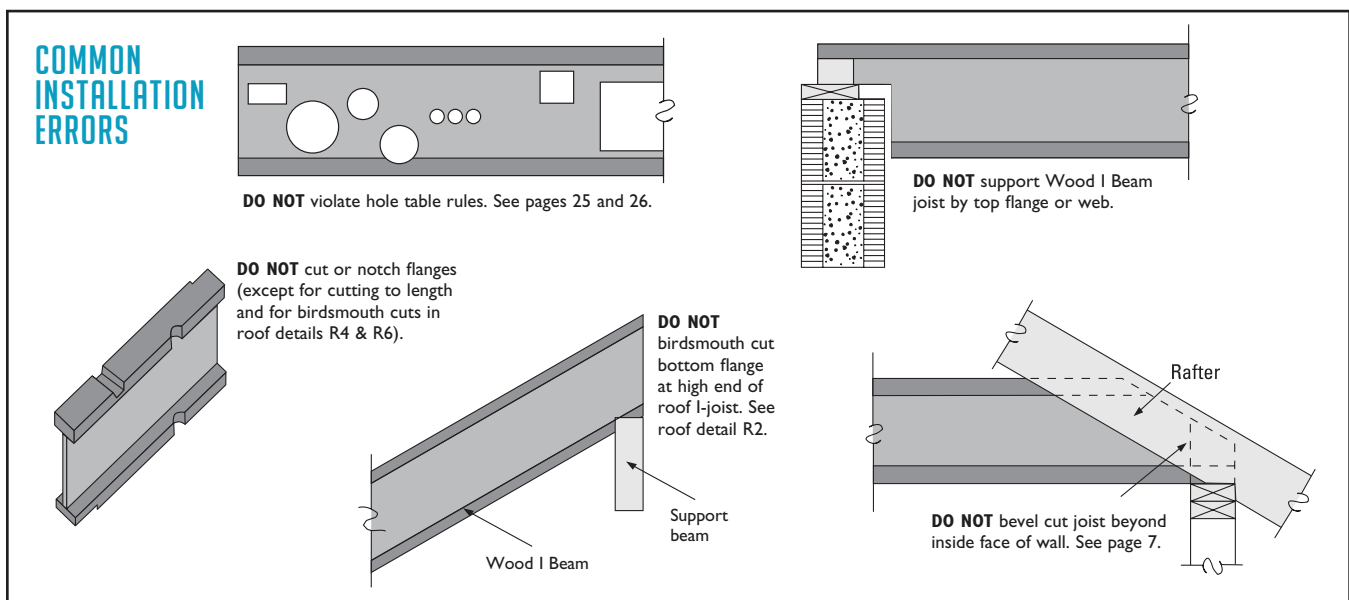

NAIL SIZE	FLANGE NAIL SPACING					
	GPI 20		GPI 40, GPI 65, GPI 90		WI 40, WI 60, WI 80	
	MIN.	MAX.	MIN.	MAX.	MIN.	MAX.
8d Box, 8d Common	3"	16"	2"	24"	4"	24"
10d Box, 12d Box	3"	16"	2"	24"	4"	24"
10d Common, 12d Common	4½"	16"	3"	24"	4"	24"

NOTES:

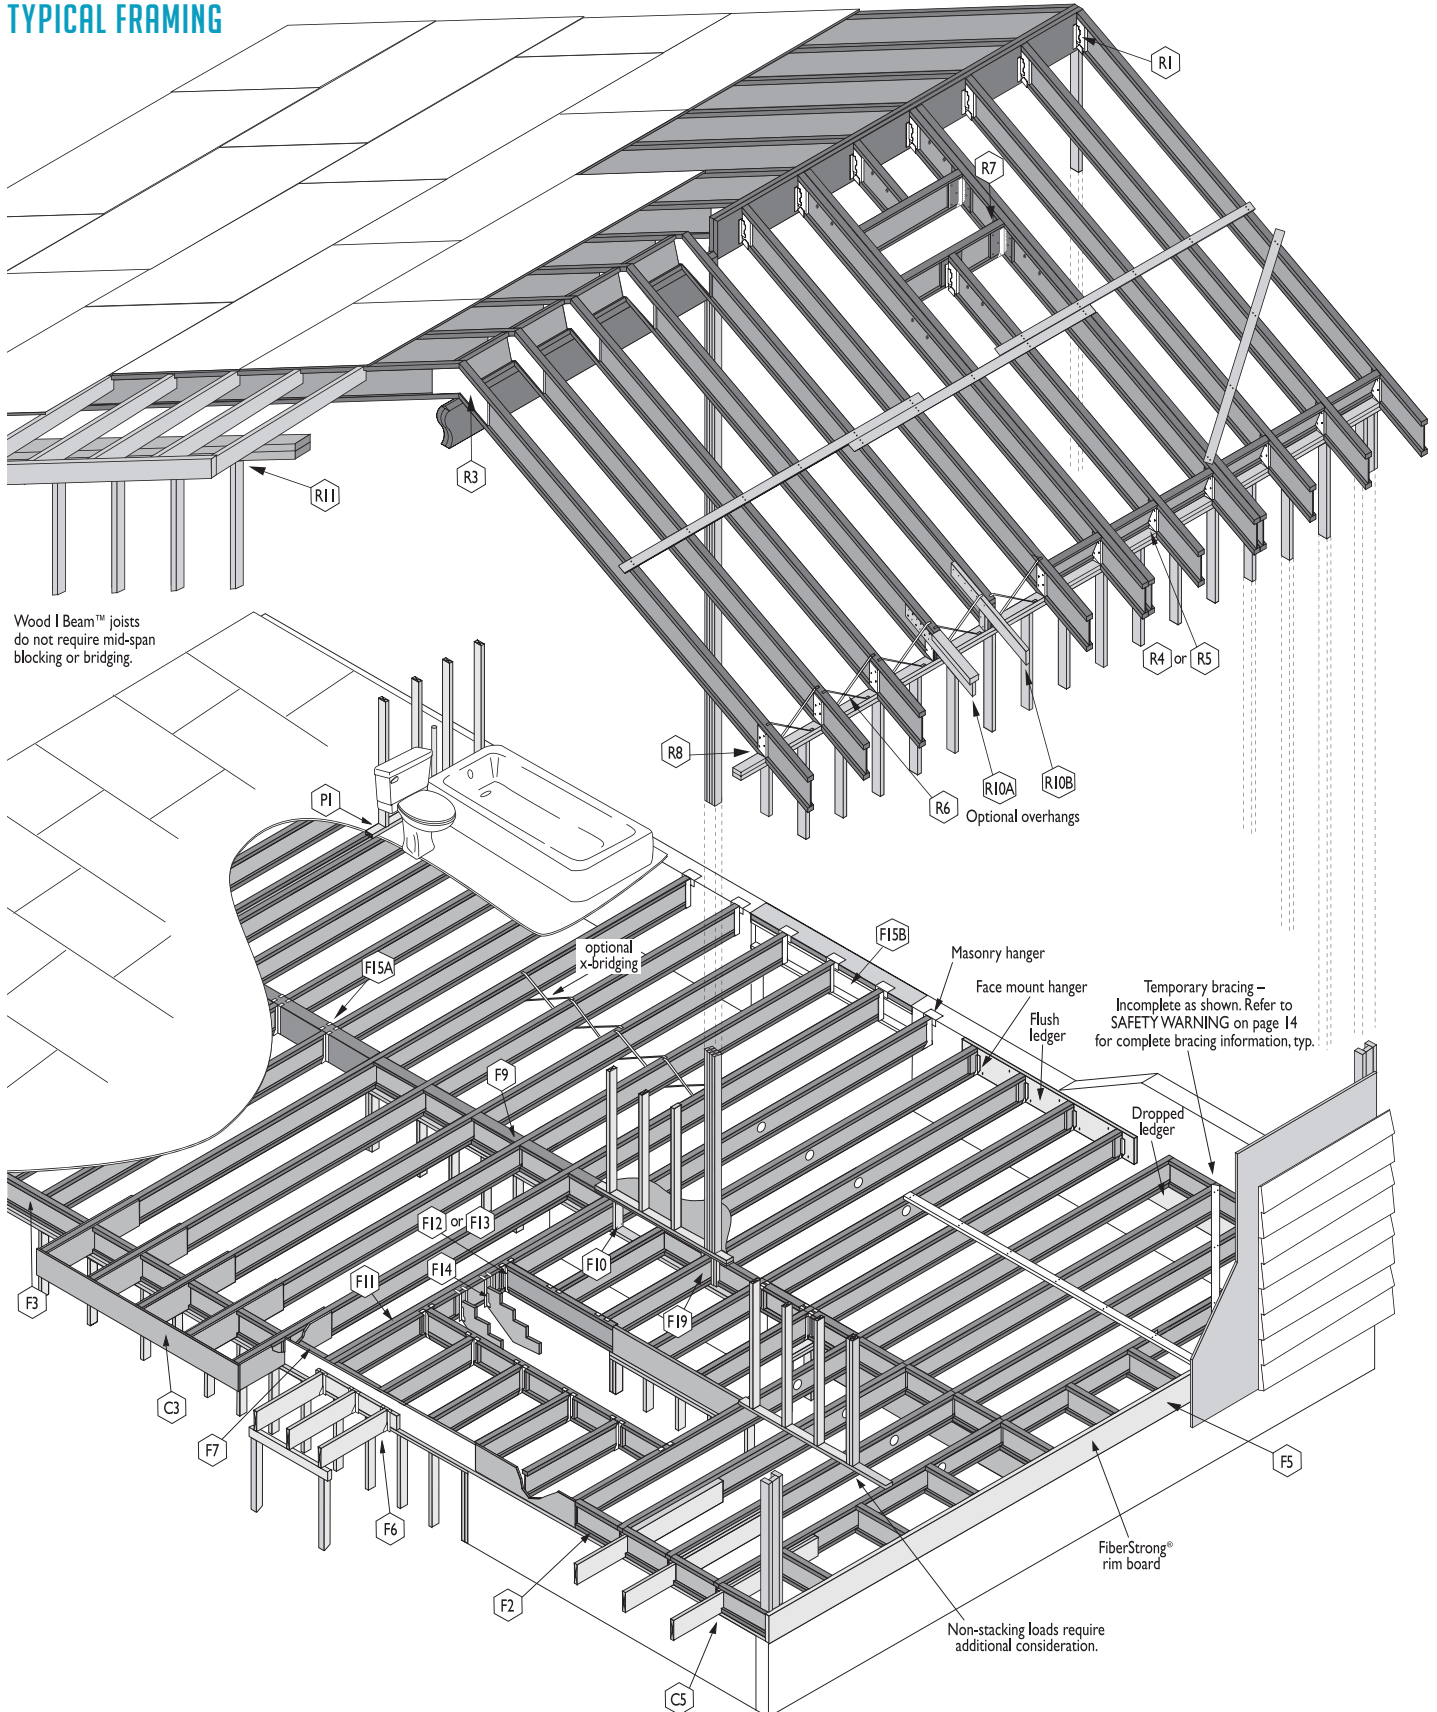

1. If more than one row of nails is required, rows must be offset by at least ½" (¾" for WI joists) and staggered.
2. 14 gauge staples may be substituted for 8d nails if staples penetrate the joist flange at least 1".
3. Do not use nails larger than those shown above when attaching sheathing to flanges of Wood I Beam joists.

Example: When using 8d common nails and GPI 20 series joists, space no closer (min.) than 3" o.c. and no farther (max.) than 16" o.c.

- E. End bearing length must be at least 1¾". Intermediate bearings of multiple span joists must be at least 3½".
- F. Wood I Beam joists must be supported on walls, beams, or in hangers. They may not be supported by a non-structural ridge board or by toe-nailing into a beam or ledger.
- G. Wood I Beam joists must be restrained against rotation at the ends of joists by use of rim joists, blocking panels, or cross bridging. To laterally restrain cantilevered joists, blocking panels must also be installed over supports nearest the cantilever. The top flange of a Wood I Beam joist must be laterally supported and kept straight within ½" of true alignment. Plytanium® Plywood or OSB sub-floor nailed to the top flange (per Note D) is adequate to provide lateral support.
- H. When nail type is not specified in this guide, use common, box or sinker.
- I. To help safeguard the structural integrity of connections with preservative or fire-retardant treated wood, use connectors and hardware as required by code and type of treatment.
- J. Certain applications of staple-up radiant heating may cause additional deflection in I-joists due to unequal drying within the floor cavity. Contact a radiant heating professional for additional information.
- K. Wood I Beam joists are manufactured without camber or specific vertical orientation. They may be installed with the identifying stamps on the side faces reading right side up or upside down.

TYPICAL FRAMING

FLOOR DETAILS

F1 ATTACHMENT AT END BEARING

One 8d (box or common) or 10d (box or sinker) nail each side at bearing, typical for all wood bearings

1 1/4" minimum end bearing length at all floor and roof details

To minimize splitting of flange and bearing plate, angle nails and start at least 1/2" from end.

F2 BLOCKING PANEL, EXTERIOR

Vertical load transfer = 2000 plf max.

Wood I Beam™ blocking panel

8d nails at 6" o.c.
Note: For shear transfer, use same nailing as required for sheathing, but complying with Installation Note D, page 15.

F3 WOOD I BEAM™ RIM JOIST

Vertical load transfer = 2000 plf max.

Wood I Beam rim joist

Provide backer for siding attachment unless nailable sheathing is used.

8d nails at 6" o.c.
Note: For shear transfer, use same nailing as required for sheathing, but complying with Installation Note D, page 15.

Minimum 1 1/4" joist bearing at wall

Toe-nail rim joist to top flange of joist with 10d nail.

F4 SQUASH BLOCKS & SINGLE RIM

Vertical load transfer = 2000 plf max. along load bearing wall

2 3/32" 48/24 APA Rated® sheathing where allowed by local code or use F5

Squash Blocks (2x4 minimum)

8d nails at 6" o.c., toe-nail to plate, typical
Note: For shear transfer, see APA EWS Y250.

8d nail top and bottom flange

8d nail into top flange

8d nail into bottom flange or plate

See detail F7 for additional braced wall blocking requirements.

Check local building code for appropriate detail in areas of high lateral load.

F5 FIBERSTRONG® RIM CLOSURE AND DECK ATTACHMENT

Vertical load transfer of rim board = 4850 plf

Do not butt ends at joist location.

One 2x4 min. with 1/8" gap at top, fasten with 8d box nails from each web into 2x...

Blocking where required by local codes for lateral load transfer and/or optional blocking for diaphragm nailing

Starter joist

FiberStrong rim board

8d nails top and bottom flange

1/2"

1/2"

(3) 8d nails at corners

FiberStrong rim board

8d nails at 6" o.c. toe-nail to plate, typical
Note: For shear transfer, use same nailing as required for sheathing, but complying with Installation Note D, page 15.

Metal flashing—under weather barrier at top, over weather barrier at bottom

1/2" sheathing with weather barrier

Siding

Weather Barrier

Sheathing

FiberStrong rim board

Extend flashing below 2x _ ledger and over siding.

2x PT ledger attached with 1/2" diameter through-bolts with washers and nuts or 1/2" lag screws with tip extending a minimum of 1/2" beyond rim board. (See note I, page 15.) Capacity is 350 pounds per fastener. Bolt / lag screw spacing to be determined by design vertical and lateral load. Lower fastener may alternately be located in wall plate. Use high quality caulk to fill holes and seal flashing.

CAUTION: The lag screw should be inserted in a lead hole by turning with a wrench, not by driving with hammer. Over-torquing can significantly reduce the lateral resistance of the screw and therefore should be avoided.

Check local building code for appropriate detail in areas of high lateral load.

FLOOR DETAILS (CONTINUED)

F7 BLOCKING PANELS USED FOR BRACED WALL

Single layer $2\frac{3}{32}$ " 48/24 rated sheathing rim provides 1000 plf vertical load transfer (two layers=2000 plf). $2\frac{3}{32}$ " plywood or OSB rim allowed only with joist depths up to $11\frac{7}{8}$ " unless used with 2x4 min. squish blocks as shown in detail F4. Fasten to end of joists and plate as indicated for FiberStrong® rim board in F5.

Note: For shear transfer, use same nailing as required for sheathing, but complying with Installation Note D, page 15.

Blocking panels installed for braced wall requirements. Locate as required by code.

Check local building code for appropriate detail in areas of high lateral load.

F8 BEVEL CUT JOIST

Do not bevel cut joist beyond inside face of support.

Note: Wood I Beam™ or FiberStrong rim board blocking, or x-bridging required at bearing for lateral support.

Check local building code for appropriate detail in areas of high lateral load.

F9 BLOCKING PANEL, INTERIOR

Vertical load transfer = 2000 plf max. along load bearing wall.

Load bearing wall must stack over blocking and wall or beam below.*

When two joists meet over wall, provide $1\frac{3}{4}$ " minimum bearing for each joist and install blocking panel to restrain both joists.

Blocking panels not required when joists are continuous over wall and no load bearing wall exists above.

8d nails at 6" o.c. (or per design professional's specs., but complying with Installation Note D, see page 15)

*Non-stacking load bearing walls require additional consideration.

F10 SQUASH BLOCKS AT INTERIOR BEARING

Vertical load transfer = 2000 plf max along load bearing wall.

Load bearing wall must stack over squash blocks and wall or beam below. Non-stacking load bearing walls require additional consideration.

Attach joist with one 10d box or sinker nail on each side of bearing.

8d nail into top flange

8d nail into bottom flange or plate

Squash block (2x4 minimum) used only if load bearing wall exists above

Bearing wall, GP Lam® LVL or glulam beam

Check local building code for appropriate detail in areas of high lateral load.

F11 DOUBLE JOIST CONSTRUCTION WITH FILLER

JOIST SERIES	JOIST DEPTH	REGULAR FILLER BLOCKING USE IN DETAIL F12	FULL-DEPTH FILLER BLOCKING USE IN DETAILS C4, F13, F14 & R7

Filler blocking

1/8" gap

- Support back of web during nailing to prevent damage to web-flange connection.
- Leave 1/8" gap between top of filler blocking and bottom of top flange.
- Block solid between joists. For all applications except cantilever reinforcement, filler need not be one continuous length, but must extend the entire length of span. For double I-joist cantilever reinforcement C4, filler must be one continuous piece extending the full length of the reinforcement.
- Place joists together and nail from each side with 2 rows of 10d (16d for WI 80 and GPI 90) nails at 12" o.c., clinched when possible. Stagger rows from opposite sides by 6".

Note: Filler blocks and fastening between joists can be omitted when double joists are loaded evenly from above to the tops of both joists, such as when a parallel bearing wall is directly centered over the double joist.

- 0 - No reinforcement is required. See Detail C1.
- 1 - Single Reinforcement is required. See Detail C2.
- 2 - Double Reinforcement is required. See Detail C3 or C4.
- X - Joist does not work. Select closer spacing or deeper joist.

NOTES:

1. Assumes floor load of 40 psf live load at L/480, 10 psf dead load and maximum joist simple spans.
2. Assumes exterior wall load of 80 plf. Wall load based on 3'-0" maximum width window or door openings. For larger openings, or multiple 3'-0" width openings spaced less than 6'-0" o.c., additional joists beneath the opening's cripple studs may be required.
3. Roof loads use a load duration factor of 115%.
4. This table was designed to cover a broad range of applications. It may be possible to exceed these limitations by analyzing a specific application using FASTBeam® selection software.
5. For stick-built roofs braced to interior supports, with loadings shown above, this table will be conservative. Use FASTBeam software to check for a more economical design.

CANTILEVER DETAILS

C1 CANTILEVER, UNREINFORCED

For allowable wall/roof loads on cantilever, use cantilever table, FASTBeam® software or contact Georgia-Pacific.

Note: Wood I Beam joists must be protected from the weather.

C2 CANTILEVER, REINFORCED
Single Sheathing/Rim Board (Option I)

For allowable wall/roof loads on cantilever, use cantilever table, FASTBeam® software or contact Georgia-Pacific.

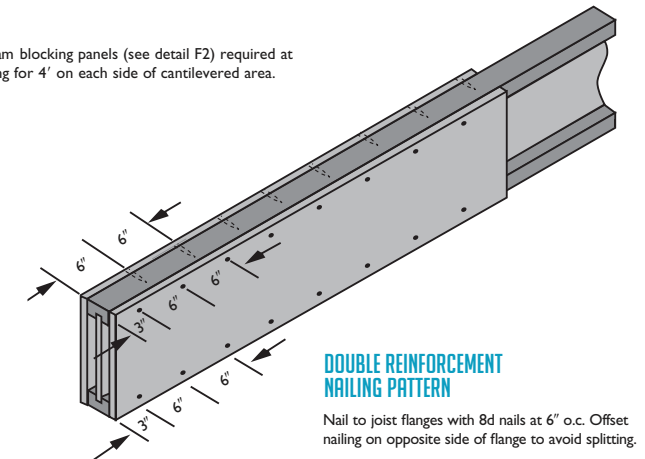

Note: FiberStrong rim board or 48/24 APA Rated sheathing (strength axis horizontal) required one side of joist. Depth must match full depth of joist. Nail to joist flanges with 8d nails at 6" o.c.

C3 CANTILEVER, REINFORCED
Double Sheathing/Rim Board (Option II)

For allowable wall/roof loads on cantilever, use cantilever table, FASTBeam® software or contact Georgia-Pacific.

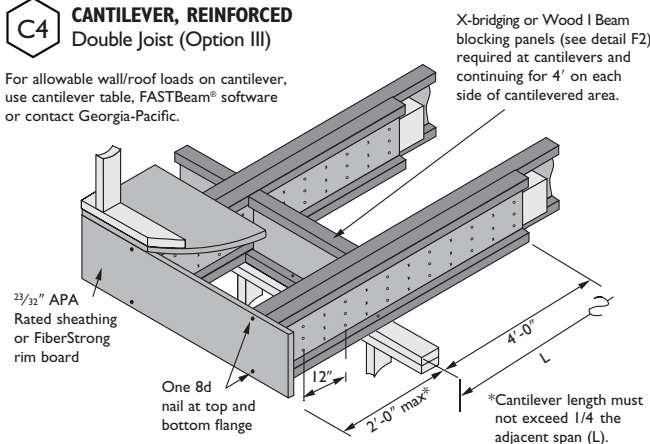

Note: FiberStrong rim board or 48/24 APA Rated sheathing (strength axis horizontal) required both sides of joist. Depth must match full depth of joist.

C4 CANTILEVER, REINFORCED
Double Joist (Option III)

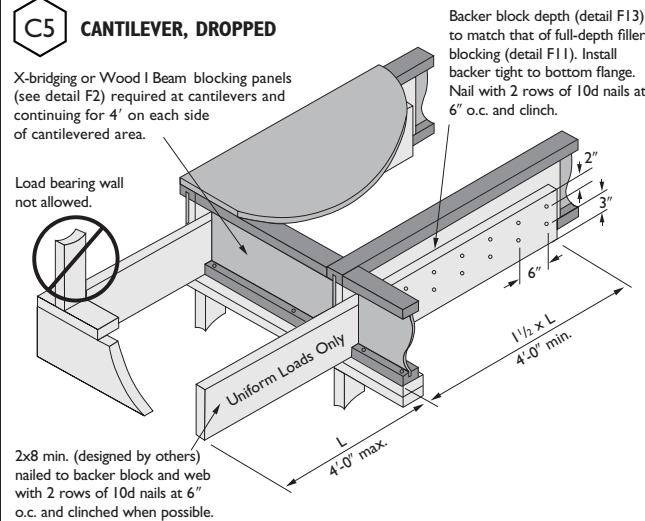

For allowable wall/roof loads on cantilever, use cantilever table, FASTBeam® software or contact Georgia-Pacific.

Note: Block together full length with full-depth filler blocking. See detail F11 for filler size, except filler must be one continuous length. Use 2 rows of 10d (16d for WI 80 and GPI 90) nails at 12" o.c. from each side; offset opposite side nailing by 6". Clinch nails when possible.

C5 CANTILEVER, DROPPED

X-bridging or Wood I Beam blocking panels (see detail F2) required at cantilevers and continuing for 4' on each side of cantilevered area.

NOTES:

- Hole locations are based on worst case of simple and multiple span conditions with uniform floor loads of 40 PSF live load and 10 or 20 PSF dead load, and spans from page 6.
- Small holes not greater than 1.5" in diameter can be placed anywhere in the web, but each hole must be spaced a minimum horizontal clear distance of 2 times its diameter (but not less than 1") from any adjacent hole. No more than two small holes can be placed next to each other and/or adjacent to larger holes following the guidelines in this note. More than one group of small holes is permitted on a joist, but adjacent groups must be spaced a minimum horizontal clear distance of 12".
- For holes greater than 1.5" diameter, minimum clear distance between
 - two round holes is 2 times the diameter of the larger hole
 - a round hole and a rectangular hole is the larger of 2 times the hole diameter or twice the rectangular hole width
- For rectangular holes, the longest side may not exceed 75% of a round hole diameter permitted at that location; i.e., if an 8 inch round hole is permitted, the longest side of a rectangular hole centered at that location is 8" x 0.75 = 6".
- A group of round holes at approximately the same location shall be permitted if they meet the requirements for a single round hole circumscribed around them.
- For joists with more than one span, use the longest span to determine hole location in either span. For large differences in adjacent span lengths, use FASTBeam® software.
- All holes shown on this table may be located vertically anywhere within the web; a clear distance of at least 1/8" must be maintained from the hole edge to the inner surface of the closest flange.
- For other conditions use FASTBeam software. Analysis using FASTBeam software could permit larger holes, or holes closer to the supports than shown in this table.

EXAMPLE:

Determine the allowable location of a 9" round hole in a 14" deep GPI Series joist which spans 20'.
 Enter the table in the left column and find 14" joist depth, move to the right and find 20' in the joist span column and move across the table to intersect the 9" round hole column. The nearest allowable location to either bearing is 6'-9".

HOLE LOCATION FOR GPI 90 AND WI SERIES (SIMPLE OR MULTIPLE SPAN)

Do not drill or cut flanges.

Table dimension is minimum distance from inside face of support to nearest edge of hole.

NOTES:

- Hole locations are based on worst case of simple and multiple span conditions with uniform floor loads of 40 PSF live load and 10 or 20 PSF dead load, and spans from page 6.
- Small holes not greater than 1.5" in diameter can be placed anywhere in the web, but each hole must be spaced a minimum horizontal clear distance of 2 times its diameter (but not less than 1") from any adjacent hole. No more than two small holes can be placed next to each other and/or adjacent to larger holes following the guidelines in this note. More than one group of small holes is permitted on a joist, but adjacent groups must be spaced a minimum horizontal clear distance of 12".
- For holes greater than 1.5" diameter, minimum clear distance between
 - two round holes is 2 times the diameter of the larger hole
 - a round hole and a rectangular hole is the larger of 2 times the hole diameter or twice the rectangular hole width
- For rectangular holes, the longest side may not exceed 75% of a round hole diameter permitted at that location; i.e., if an 8 inch round hole is permitted, the longest side of a rectangular hole centered at that location is $8" \times 0.75 = 6"$.

- A group of round holes at approximately the same location shall be permitted if they meet the requirements for a single round hole circumscribed around them.
- For joists with more than one span, use the longest span to determine hole location in either span. For large differences in adjacent span lengths, use FASTBeam® software.
- All holes shown on this table may be located vertically anywhere within the web; a clear distance of at least 1/8" must be maintained from the hole edge to the inner surface of the closest flange.
- For other conditions use FASTBeam software. Analysis using FASTBeam software could permit larger holes, or holes closer to the supports than shown in this table.

EXAMPLE:

Determine the allowable location of a 9" round hole in a 14" deep WI Series joist which spans 20'.
 Enter the table in the left column and find 14" joist depth, move to the right and find 20' in the joist span column and move across the table to intersect the 9" round hole column. The nearest allowable location to either bearing is 6'-9".

NOTES:

- Capacity is for the stated duration of load – 100% floor loading – 115% roof snow loading. Connector capacity depends on the model selected, required quantity and size of fasteners used, and the size and type of connector support. "Rect Hdr" connector capacities are based on the lesser value of GP Lam LVL or DF-L/SP (glulam or lumber) headers. SPF web fillers have been assumed for WI 80, GPI 90, and all double face mount hangers, while DF-L or SP web fillers have been assumed for all other fasteners through I-joist webs. "I-J Hdr" connector capacities assume a one-ply or multi-ply I-joist header with the same series and depth as the I-joist supported. All nails into the I-joist flange must be 10d x 1½". Refer to connector manufacturer for the potential for higher capacities and expanded design information. Consult a qualified designer when maximum joist reactions exceed connector/header/fastener combinations. VPA and TMP connectors do not permit increases for duration of load and capacities are based on SPF wood plates. Clinch nails across grain when possible.
- "Rect Hdr" capacities shown are based on 10d header nails. Refer to detail F12.
- Refer to details F13 and R1.

- Bearing stiffeners required for I-joists. Refer to details F13 and F18.
 - Rectangular header assumed. For I-joist header, multiply table value by 0.86. Beveled bearing stiffeners are required. Refer to detail R8. Maximum slope is 12/12. A tie strap is required for all I-joists with slopes of 3/12 and greater. Refer to detail R1.
 - TMP connectors may be used for slopes of 1/12 through 6/12. For greater slopes use TMPH series connectors with bearing stiffeners.
 - Nailing key: 10d x 1½" nails are required where only the number of nails is shown. "H" column indicates size of nails to connect hanger to supporting header. "J" column indicates nails to attach the hanger to the joist. "P" indicates nails to connect to plate. Fill all nail holes as required by hanger manufacturer. Clinch all nails that protrude on the back side. Nails 10d x 1½" are 0.148" x 1½" long, 10d nails are 0.148" x 3" long and 16d are 0.162" x 3½" long.
- NOTE:** Model numbers shown are for United Steel Products Company, Inc. 1-800-328-5934 and Simpson Strong-Tie® Company, Inc. 1-800-999-5099. Other designs are available for specialized applications. Contact your local building material supplier for connector availability.

NOTES:

- A. Allowable moment may not be increased for any code allowed repetitive member use factor.
- B. Allowable moment, shear, and reaction values are for normal duration loading and may be increased for other load durations in accordance with code.
- C. Allowable end reaction is based on a minimum bearing length of 1 3/4" without bearing stiffeners. For a bearing length of 4", the allowable end reaction may be set equal to the tabulated shear value. Interpolation of the end reaction between 1 3/4" and 4" bearing is permitted. For end reaction values over 1550 lbs. (1900 lbs. for GPI 90), bearing stiffeners are required.
- D. Allowable intermediate reaction is based on a minimum bearing length of 3 1/2".
- E. Weight of joists for dead load calculations. For shipping weights contact Georgia-Pacific at 877-437-9759.

$$\text{APPROXIMATE DEFLECTION* (Inches)} = \frac{22.5 \times W \times L^4}{EI} + \frac{W \times L^2}{C}$$

- W = Uniform Load (lbs/foot)
- L = Span (feet)
- EI = Stiffness Constant (in²-lbs)
- C = Shear Deflection Constant (ft-lbs/in)

*Constants have been adjusted to maintain unit consistency.

PLUMBING DETAILS

P1 JOIST SPACING BELOW PLUMBING WALL

Parallel to wall

Non-load bearing wall only

JOIST	2X4 WALL	2X6 WALL
GPI 20	5 1/4"	7 1/4"
GPI 40 AND 65 WI 40 AND 60	6"	8"
GPI 90/WI 80	7"	9"

Every third joist may be shifted up to 3" to avoid plumbing interference.

Chart dimension

* Provide blocking between adjacent joists when needed to support panel ends.

P2 JOIST SPACING BELOW PLUMBING

Every third joist may be shifted up to 3" to avoid plumbing interference.

May not be appropriate for some sheathing and finished flooring applications.

WOOD I BEAM™ JOIST ARCHITECTURAL SPECIFICATIONS

Part I—General

1.0—Description:

- A. Work in this section includes, but is not limited to: Prefabricated Wood I Beam™ GPI 20, GPI 40, GPI 65, GPI 90, WI 40, WI 60 and WI 80 ceiling, floor, and roof joists with enhanced OSB webs and lumber flanges (WI) or LVL flanges (GPI).
- B. Related work specified elsewhere: Rough carpentry.

1.1—Submittals:

- A. Product data: Submit manufacturer's descriptive literature indicating material composition, thicknesses, dimensions, loading and fabrication details.
- B. Shop drawings or installation guide: Manufacturer's literature indicating installation details. Include locations and details of bearing, blocking, bridging, and cutting and drilling of webs for work by others.

1.2—Quality Assurance:

- A. Certification: All Georgia-Pacific Wood I Beam joists have been qualified to ASTM D 5055 by APA-The Engineered Wood Association.

1.3—Delivery, Storage and Handling:

- A. Delivery: Deliver materials to the job site in manufacturer's original packaging, containers and bundles with manufacturer's brand name and identification intact and legible.
- B. Storage and handling: Store and handle materials to protect against contact with damp and wet surfaces, exposure to weather, breakage and damage. Provide air circulation under covering and around stacks of materials. Individual joists shall be handled in the upright position.

1.4—Limitations:

- A. Loads: Concentrated loads shall not be applied to the bottom flange.
- B. Cutting: Except for cutting to length and birdsmouth cuts, top and bottom flanges of Wood I Beam floor and roof joists shall not be cut, drilled or notched.
- C. Wood I Beam joists are for use in covered, dry-use conditions only (moisture content less than 16%).

Part 2—Products

2.0—Prefabricated Joists:

- A. Acceptable products:
 1. Georgia-Pacific, WI 40.
 2. Georgia-Pacific, WI 60.
 3. Georgia-Pacific, WI 80.
 4. Georgia-Pacific, GPI 20.
 5. Georgia-Pacific, GPI 40.
 6. Georgia-Pacific, GPI 65.
 7. Georgia-Pacific, GPI 90.

B. Characteristics:

1. Flanges:
 - Lumber flanges (width).
 - a. WI 40 (2½").
 - b. WI 60 (2½").
 - c. WI 80 (3½").
 - LVL flanges (width).
 - a. GPI 20 (1¾").
 - b. GPI 40 (2¾").
 - c. GPI 65 (2¾").
 - d. GPI 90 (3½").
2. Webs: ⅜" minimum thickness FiberStrong® OSB web.
3. Beam depths as required for loading, deflection, and span:
 - a. GPI 20 (9½", 11⅞", and 14")
 - b. GPI 40 or WI 40 (9½", 11⅞", 14", and 16")
 - c. WI 60 (11⅞", 14" and 16")
 - d. GPI 65 (11⅞", 14" and 16")
 - e. WI 80 (11⅞", 14" and 16")
 - f. GPI 90 (11⅞", 14" and 16")
4. Beam length as required for span and bearing.

2.1—Accessories:

- A. Nails: 8d, 10d, and 12d box, sinker, and common nails.
- B. Bracing and blocking:
 1. Bearing stiffeners: 2x4 or combination of ⅜", ½" or ⅝" Plywood Sturd-I-Floor® or OSB.
 2. Band joists and continuous closure at load-bearing walls: per standard approved Wood I Beam details.

 1. Model numbers are shown for United Steel Products and Simpson Strong-Tie® connectors. Contact Georgia-Pacific for other acceptable connectors.

Part 3—Execution

3.0—General:

- A. Provide Wood I Beam floor and roof joists where indicated on drawings using hangers and accessories specified.
- B. Install Wood I Beam joists in accordance with manufacturer's recommendations.
- C. Install and brace Wood I Beam floor and roof joists to prevent dominoing of system and buckling of top flange.

3.1—Accessories:

Install accessories where indicated and in accordance with manufacturer's instructions.

ENGINEERED FOR PERFORMANCE

WHAT YOU DON'T SEE MATTERS™

Georgia-Pacific Wood Products LLC
133 Peachtree Street
Atlanta, Georgia 30303
877-437-9759

When it comes to floor joists, rim board, beams and headers, builders and contractors choose Georgia-Pacific engineered lumber for many reasons. Today's residential building trends call for large, open spaces and high ceilings, creating a demand for products that provide higher strength and greater stability over longer spans.

Georgia-Pacific engineered lumber products are covered by a lifetime limited warranty. For complete warranty details, terms and conditions, please visit www.buildgp.com or call 877-437-9759.

This NGBS Green Certified mark is your assurance that a product is Home Innovation NGBS Green Certified for Resource Efficiency and Indoor Environmental Quality. Please visit Homeinnovation.com/Green for more information.

Engineered lumber from Georgia-Pacific is made from wood that is sourced through a system that is third-party certified to the Sustainable Forestry Initiative® (SFI®) procurement standard.
