

PlotSpike Forage Beans

- Produces high quality spring, summer and fall forage for deer and cattle
- Blooms very late so the plant continues to produce leaves until late in the Fall
- Establishes quickly with moisture
- Non GMO
- Plants are huge--no need to plant a lot of seed--20-25 lbs per acre is our recommendation

This is one of our seed fields. The plants are about 6 weeks old. The picture was made 8/28/2012. The beans were planted around 7/15/2012. Before harvest we could hold the vines up and they were over head high.

Planting instructions:

Plant PlotSpike Forage Beans on a well prepared seed bed about 1/2 inch deep. They will grow best in soils with a pH of 6.0-6.5 but will tolerate as low as 5.5. A general application of 300 lbs of 13-13-13 per acre will yield faster forage growth.

Plant after chance of frost.

The seed are dark brown and sort of flat and oblong.
